Summary

[1.1 MYCO.COM](#)

1 - Summary

The Linux Computer Patch Assurance Report helps verify the effectiveness of the client's patch management program. The report uses scan data to detail which updates are missing on Linux computers operating within the network. The Summary section provides a high-level overview of missing security updates, recommended updates, and other updates for Linux computers across the entire network ("- " means that we were unable to determine update status). To view more details about missing patch information for each individual workstation, see the Linux Computer Patch Assurance Details Report generated in Microsoft Excel format. Use this information to apply security updates to reduce the overall security risk to the network.
