1 - Summary

The MacOS Patch Assurance Report helps verify the effectiveness of the client's patch management program. The report uses scan data to detail which updates are missing on MacOS computers operating within the network. The Summary section provides a high-level overview of missing security updates, recommended updates, and other updates for MacOS computers across the entire network ("-" means that we were unable to determine update status). After the Summary, you can find more detailed missing patch information for each individual workstation. Use this information to apply security updates to reduce the overall security risk to the network.
